

Write-Up:

Before starting this project, I was under the impression that it would be quite simple for me to add a variety of features to a website generated by ChatGPT. I assumed that it would not take a lot of effort for it to understand what I wanted from it and how I wanted to implement it in the design of the website. In practice however, it proved to be more of a challenge for me to get the results I desired; I have realized that I am not as experienced as I thought with using AI as a tool. I've tried to use ChatGPT in the past and I found that it had trouble with continuity as our conversation went on. This issue seemed more or less non-existent when I used it for this project, which I feel helped significantly with useability.

Through this assignment I've also realized that I don't enjoy working with AI when it comes to coding, even though it does save a ton of time. I think that I'd rather work through everything myself in order to learn better, especially since I am not well-versed on the intricacies of website building. But the huge upside to using AI in website building is that you don't have to write all of the text yourself. Some of the things that I wanted to implement to this website didn't end up working, either because ChatGPT didn't understand what I wanted or because I couldn't figure out how to implement them correctly, but it was still helpful. I also thought it was funny how many comments ChatGPT likes to add to the code at some times, while other times not adding any.
